1 - Problem 1

1.1 Problems a and b

Problem 1 (a): Calculating the Upper Bound for the Raisin Product

Total Raisins Calculated	1,240,000	
Less Raisin Dedicated Portion to Grade A	(930,000)	75% <- note this is the % towards A
Grade B Portion Implied*	310,000	25% <- "" B
Total Grade B Available	5,270,000	
% Grade B Used Towards Raisins, i.e. tier 8	5.88%	

Interpretation and Assumptions:

*There must be 5.88% (Total of 310,000) of grade B's total supply that are on tier 8, which raisins are able to use since it satisfies the minimum points.

For raisins, this implies that 25% of the raisin production will stem from Grade B (and 75% towards A)

For juice, this implies that 75% of the juice production will stem from Grade B (and 25% towards A)

Note 100% Grade B used for Jelly.

Problem 1(b): Calculate the Fruit Cost seen in Table 3

Grade	Cost per Pound	
Grade A	\$ 0.45	<- noted in table 3 bullet 4
Grade B	\$ 0.25	

	Raisins	Juice	Jelly	
Pounds per Product	6.5	14.0	18.0	<- Noted in Table 2 footer

% Breakdown of Grades				
Grade A	75.0%	25.0%	0.0%	<- this is from the aboves assumptions text
Grade B	25.0%	75.0%	100.0%	<- 1 minus above
Weighted Avg. Cost per Pound	\$ 0.40	\$ 0.30	\$ 0.25	
Fruit Cost (Pounds * Wt. Avg. Cost)	\$ 2.60	\$ 4.20	\$ 4.50	<- this is how they determine the fruit cost in Table 3

1.2 Model Overview

1.3 Mathematical Formulation

1.3.1 Sets

Set Name	Description
<i>FRUIT</i>	Fruit grade levels of grapes, which are Grade A and Grade B grapes
<i>PRODUCTS</i>	Types of products to be sold, which are Raisins, Juice, and Jelly

1.3.2 Parameters

Parameter Name	Description
$amountOfFruit_f$	Tons of fruit grade ($f \in FRUIT$) available to use
$avgGradeOfFruit_f$	Avg. point quality of fruit grade ($f \in FRUIT$)
$productLimit_p$	Upper bound of production of product ($p \in PRODUCTS$)
$poundsPerProduct_p$	The amount of pounds associated with a single unit of product ($p \in PRODUCTS$)
$contrToProfit_p$	The contribution to profit of a product ($p \in PRODUCTS$)
$netProfit_p$	The net profit (<i>net of OH allocation</i>) of a product ($p \in PRODUCTS$)
$productGradeLimit_p$	Requirement of mean point quality of a product ($p \in PRODUCTS$)

1.3.3 Decision Variables

Variable Name	Description
$produce_{f,p}$	The <i>number</i> of products ($p \in PRODUCTS$) to be produced by fruit grade ($f \in FRUIT$)

1.3.4 Objective Function

$$Maximize\ Net_Profit = \sum_{f \in FRUIT, p \in PRODUCTS} produce_{f,p} \times netProfit_p$$

1.3.5 Constraints

C1: Number of products produced ($p \in PRODUCTS$) must be less than or equal to tons of fruit provided ($f \in FRUIT$)

$$maxTons : \sum_{p \in PRODUCTS} produce_{f,p} \times poundsPerProduct_p \leq amountOfFruit_f, \forall f \in FRUIT$$

2 - Problem 2

3 - Problem 3

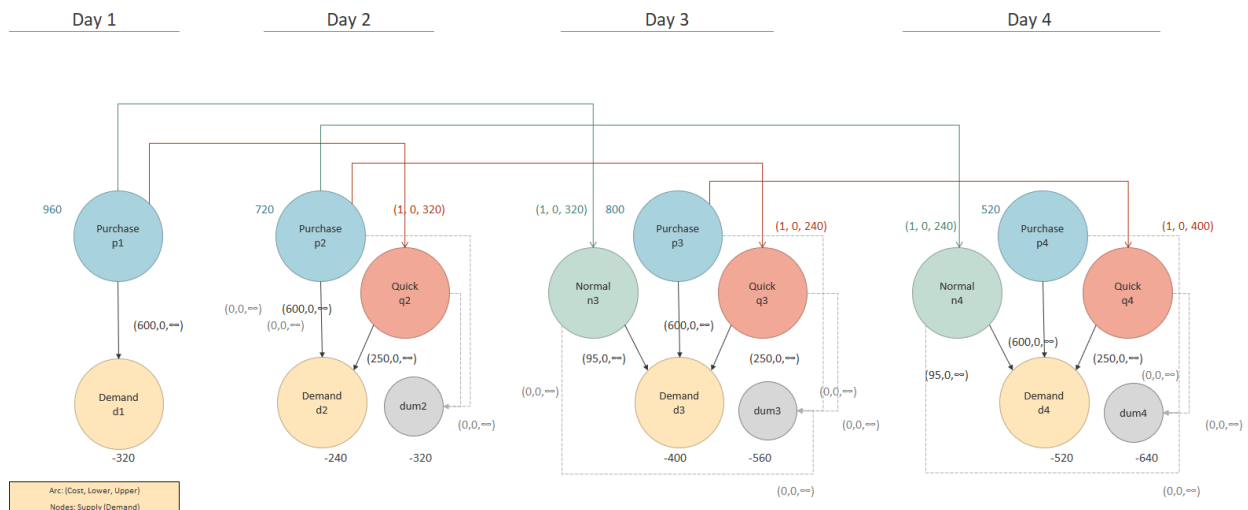

3.1 Model Overview

3.1.1 Assumptions and Calculations for Network Flow Diagram

- Below shows how we decided to balance the network with supply and dummy nodes
- In order to obtain a balanced network (i.e. supply equals demand), we must allow for all possible routes to have enough supply.
- Excess supply allowed on certain days is captured by dummy nodes so that the business does not actually produce the tires.

Determine Supply and Dummy Allocation					
Day	Demand (d)	Incoming Arcs (in)	Potential Supply $in * d$	Dummy Allocation $d_{day-1} + d_{day-2}$	
1	-320	3	960	0	
2	-240	3	720	-320	
3	-400	2	800	-560	
4	-520	1	520	-640	

3.1.2 Network Flow Diagram

3.2 Mathematical Formulation

3.2.1 Sets, Parameters, Decision Vars

Set Name	Description
<i>NODES</i>	Set of all nodes in above network flow diagram:
p1 p2 p3 p4	Number of tires to <i>purchase</i> on day $\in(1-4)$
n1 n2 n3 n4	Number of tires to reshape using the <i>normal</i> service on day $\in(1-4)$
q1 q2 q3 q4	Number of tires to reshape using the <i>quick</i> service on day $\in(1-4)$
d1 d2 d3 d4	Demand of tires on each day $\in(1-4)$
dum2 dum3 dum4	Dummy nodes to balance excess supply for days 2 3 and 4 $\in(2-4)$. Do not need one for day 1 since purchasing

The set A is a set of *arcs*, e.g. (i, j) for $i \in N, j \in N$ each of which may carry *flow of a commodity*

Decision variable: x_{ij} determines the units of flow on arc (i, j)

Arc (i, j)

- cost c_{ij} per unit of flow on arc (i, j)
- upper bound on flow of u_{ij} (capacity)
- lower bound on flow of ℓ_{ij} (usually 0)

3.2.2 Objective, and Constraints

$$\begin{aligned}
 &\text{minimize} && \sum_{(i,j) \in A} c_{ij} x_{ij} \\
 &\text{subject to} && \sum_{j:(i,j) \in A} x_{ij} - \sum_{j:(j,i) \in A} x_{ji} = b_i \quad \forall i \in N \\
 &&& \ell_{ij} \leq x_{ij} \leq u_{ij} \quad \forall (i, j) \in A
 \end{aligned}$$

- Upper and lower bounds use to direct the flow of tires from *purchasing* to *quick* or *normal* service

3.3 Code and Output

3.3.1 Model: group12_HW2_p3.mod

- Used mcnpf.txt from course website and renamed to group12_HW2_p3.mod.
- Added data group12_HW2_p3.dat; solve; and display x;

3.3.2 Data: group12_HW2_p3.dat

```

4 - Problem 4

4.1 Model Overview

4.1.1 Assumptions and Calculations for Network Flow Diagram

- Goal of below tables are to put all data on a *per unit of product* basis
- Need to be on per unit basis so that we can effectively minimize the cost
- *Color of tables* correspond to the network nodes on the next page

Labor, Manufacturing, and Transportation Cost Calculations for Arcs

Labor (Cost per Unit Output and Total Supply Available)					
Type	Cost per Person	Unit Output per Person	Cost / Unit	Total Labor Avail	TTL Product Supply
Specialist	\$ 2,000	12	\$ 166.67	100	1,200
Generalist	\$ 1,700	10	\$ 170.00	200	2,000

Cost of Transportation			
	Scranton, PA	Utica, NY	Stamford, CT
Per Person	300	250	275
Per Unit of Product (trans. Cost / unit output by type)			
Specialist	\$ 25.00	\$ 20.83	\$ 22.92
Generalist	\$ 30.00	\$ 25.00	\$ 27.50

Cost of Transportation + Labor per Unit of Output			
	Scranton, PA	Utica, NY	Stamford, CT
Specialist	\$ 191.67	\$ 187.50	\$ 189.58
Generalist	\$ 200.00	\$ 195.00	\$ 197.50

Plant Production Limits			
	Base	OT	OT Mult
Scranton	505	100	1.5
Utica	465	100	1.5
Stamford	570	100	1.5

Manufacturing and Transportation Costs			
	Manufacture	Goggle	Faceblock
Scranton	\$ 90	\$ 8	\$ 15
Utica	\$ 105	\$ 14	\$ 18
Stamford	\$ 115	\$ 24	\$ 20

Man. + Trans Cost	
Goggle	Faceblock
\$ 98	\$ 105
\$ 119	\$ 123
\$ 139	\$ 135

4.1.2 Network Flow Diagram

4.2 Mathematical Formulation

4.2.1 Sets, Parameters, Decision Vars

Set Name	Description
<i>NODES</i>	Set of all nodes in above network flow diagram:
Specialist, Generalist	The two types of Supply of Labor
ScranMult1x, UticaMult1x, StamMult1x	Passed through if <i>did not</i> use overtime
ScranMultOT, UticaMultOT, StamMultOT	Passed through if <i>did</i> use overtime
Scranton, Utica, Stamford	Transshipment nodes which are the plants
dumPlant, dumBus	Dummy nodes that account for excess supply from unbalanced supply from labor nodes

The set A is a set of *arcs*, e.g. (i, j) for $i \in N, j \in N$
each of which may carry *flow of a commodity*

Decision variable: x_{ij} determines the units of flow on arc (i, j)

Arc (i, j)

- cost c_{ij} per unit of flow on arc (i, j)
- upper bound on flow of u_{ij} (capacity)
- lower bound on flow of ℓ_{ij} (usually 0)

4.2.2 Objective, and Constraints

$$\begin{aligned}
 &\text{minimize} && \sum_{(i,j) \in A} c_{ij} x_{ij} \\
 &\text{subject to} && \sum_{j:(i,j) \in A} x_{ij} - \sum_{j:(j,i) \in A} x_{ji} = b_i \quad \forall i \in N \\
 &&& \ell_{ij} \leq x_{ij} \leq u_{ij} \quad \forall (i, j) \in A
 \end{aligned}$$

- Upper and lower bounds use to direct the flow of the product

4.3 Code and Output

4.3.1 Model: group12_HW2_p4.mod

- Used mcnpf.txt from course website and renamed to group12_HW2_p4.mod.
- Added data group12_HW2_p4.dat; solve; and display x;

4.3.2 Data: group12_HW2_p4.dat
